China

Geopolitics / Research snapshot: 05 Jun 2025

China is the world’s largest manufacturing economy and a central node in global trade, technology supply chains, and the market for industrial demand.

What is happening?

Policy is prioritizing advanced manufacturing and strategic autonomy while domestic demand remains uneven. Export competitiveness is rising in clean technology and machinery, widening trade friction with major partners.

Why it matters

China changes the marginal price of goods, the structure of supply chains, and the bargaining power of technology platforms. It is both a growth question and a source of regime-level tail risk.

Risk assessment

An escalation in trade restrictions or a disorderly property deleveraging could transmit through commodities, industrial earnings, and cross-border capital flows.

What to monitor

01 Property starts and land sales

02 Export orders and shipping rates

03 Industrial policy announcements

04 CNY fixing and capital flows

Timeline

2018 US-China tariff regime begins

2021 Common prosperity reframes domestic policy

2023 Property adjustment becomes the central drag

2025 Overcapacity becomes a trade flashpoint
